

Introduction to Natural Language processing

Natural language processing (NLP): Subfield of linguistics, computer science, and information engineering concerned with the interactions between computers and human (natural) languages, in particular how to program computers to process and analyze large amounts of natural language data.

What is it all about?

What's that all about

Let's start with the basics:

we speak

we read

we write

all that using language

But that's not all...

- we think of the world around us
- we dream
- we make decisions and plans
- all in natural language, i.e. in words

What are the raw materials for NLP revolution?

- 1. Data:** There is a huge amount of human knowledge that has been digitized.
- 2. Compute:** Our personal computers are very powerful, and it has never been easier to rent more compute power.
- 3. Algorithms:** We use a combination of Computer Science, Machine Learning, Deep Learning, and linguist techniques.

Why NLP is hard?

It's the nature of the human language that makes NLP difficult.

Some examples:

- 1. Ambiguity:** One word/sentence can have different meanings.

أَلَمْ أَلَمْ أَلَمْ أَلَمْ بِدَائِهِ
إِنْ أَنْ أَنْ أَنْ أَنْ أَوَانِهِ

المتنبي

المعنى

(وجع) (أحاط بي) (لم) (أعلم) (يمرض)
(إذا) (توجع) (المريض) (حان) (وقت) (شفائه)

2. Spelling Errors: There are some words that are usually misspelled by people.

Top 10 Misspelled Words

separate	✓	seperate	✗
calendar	✓	calender	✗
unnecessary	✓	unecessary	✗
questionnaire	✓	questionaire	✗
accidentally	✓	accidentaly	✗
necessary	✓	neccessary	✗
surprise	✓	suprise	✗
embarrass	✓	embarass	✗
accommodation	✓	accomodation	✗
receive	✓	recieve	✗

3. Phonetics and Phonology: Different words that have the same pronunciation.

- there / their
- plane / plain
- ice cream / I scream

4. Order of Context: "Dog bites man" and "Man bites dog" have vastly different meanings

In ML terms, why is NLP hard?

1. Input: Large, discrete, open-ended input state spaces

2. Output: Variable length output spaces

3. Algorithms: Recycled from other fields

Top Used Text File Types

- CSV
- Text Files
- JSON
- SQL
- HTML
- PDF
- DOCX

NLP Libraries

There are many popular NLP libraries that we will cover in the next labs. In this lab, we will get introduced to NLTK.

NLTK

Natural Language Toolkit (nltk) is a Python package for NLP <https://www.nltk.org/>

What are Corpus / Corpora?

a collection of written texts, especially the entire works of a particular author or a body of writing on a particular subject.

```
!pip install nltk
```

```
import nltk
```

Arabic Libraries (Extra)

Camel-Tools: <https://camel-tools.readthedocs.io/en/latest/>

PyArabic: <https://pyarabic.readthedocs.io/ar/latest/>

Farasa: <https://farasa.qcri.org/>

NLP Applications

1. Information Extraction

The automated retrieval of specific information related to a selected topic from a body or bodies of text.

2. Machine Translation

The process of using artificial intelligence to automatically translate text from one language to another without human involvement.

3. Sentiment Analysis

Identifying sentiments and opinions stated in a text.

Example of an NLP Pipeline

1. Text Acquisition:

Obtain the text data from a source, such as a file, a web page, or a database.

2. Text Preprocessing:

- **Tokenization:** Split the text into individual words or tokens.
- **Lowercasing:** Convert all tokens to lowercase to ensure uniformity.
- **Removing Punctuation:** Strip away punctuation marks from tokens.
- **Stopword Removal:** Eliminate common words (e.g., "and," "the," "is") that may not carry significant meaning.
- **Stemming:** Removes prefixes/suffixes to get a root form. (Running -> run)
- **Lemmatization:** Converts word to base/dictionary form (lemma). (better -> good).

3. Feature Extraction:

- **Bag-of-Words (BoW):** Create a vector representation of the text using the frequency of each token in the document.
- **TF-IDF (Term Frequency-Inverse Document Frequency):** Assign weights to tokens based on their importance in the document relative to the entire corpus.

4. Model Building:

Choose a machine learning model for sentiment analysis, such as a Naive Bayes classifier, Support Vector Machine (SVM), or a neural network.

Task#1:

Students should work in groups and search online for one of the different types of datasets. • CSV • Text Files • JSON • SQL • HTML • PDF • DOCX

Task#2:

Download and open the dataset.

```
conda install kagglehub
```

```
Jupyter detected...
```

```
Note: you may need to restart the kernel to use updated packages.
```

```
==> WARNING: A newer version of conda exists. <==  
current version: 25.5.1  
latest version: 25.7.0
```

```
Please update conda by running
```

```
$ conda update -n base -c defaults conda
